

CASE STUDY

Swift assists a national wireless carrier by providing a customized application geared at meeting environmental regulations and tight deadlines.

Issue

We work with one of the largest wireless phone carriers in the country which recently acquired another large national carrier. A number of the cell sites acquired by our customer were no longer needed and they were under a tight deadline to remove them due to expiring lease agreements. Each of these sites was populated with battery systems that had to be detached before the remaining equipment could be removed. In addition, we were required to document the movement of these batteries due to environmental regulations.

Idea

We were able to design an application that allowed us to completely automate the process. When our crews left each of the expiring cell sites with the batteries, we were able to upload and process the documentation immediately. We were able to deliver the required environmental paperwork to the customer, while the application tracked the accumulated batteries and developed proper shipping documents for the truckloads being returned to the recyclers.

Impact

The custom solution we created and implemented enabled our customer to accomplish their objectives ahead of schedule. Thanks to how efficiently and quickly we completed this project, we were awarded additional work where we were able to once again implement our customized solution and finish a second project ahead of schedule.
